For PC/Windows 7 (All Compatible with Dolphin).Leptin regulates telomerase expression in hepatoma cells through cyclic AMP-responsive element-binding protein/p300-mediated epigenetic alterations. Leptin suppresses the proliferation of hepatocellular carcinoma (HCC) cells through a mitogen-activated protein kinase-dependent pathway. Telomerase is an immortalizing enzyme and is activated in HCC. Thus, to identify novel transcriptional targets for leptin-induced growth inhibition in HCC, the authors used subtraction cloning. A novel leptin-responsive HCC cell line, Hep3B, was developed. Northern blot analysis showed that telomerase expression was rapidly and markedly decreased in Hep3B cells in a time-dependent manner after leptin treatment. Because telomerase expression is regulated by cAMP-response element-binding protein (CREB) via phosphorylation of CREB/activating transcription factor-2alpha (ATF-2alpha), the authors investigated whether leptin could activate CREB/ATF-2alpha signaling. Treatment with leptin induced phosphorylation of CREB/ATF-2
